

Document 19: Health Document Sharing Standards

Interoperability in healthcare relies on standardized methods for sharing clinical documents. Initiatives such as Integrating the Healthcare Enterprise (IHE) have developed profiles like Cross-Enterprise Document Sharing (XDS) and Mobile Health Document Sharing (MHD). These frameworks support the secure, efficient exchange of patient records across different healthcare organizations. Key features include patient identification, access control, audit trails, and support for multiple document formats. Adoption of these standards improves care coordination, reduces duplication, and enhances patient safety.
