

Malaria - Transmission and Control

Malaria is a life-threatening disease caused by Plasmodium parasites, transmitted to humans through the bite of infected female Anopheles mosquitoes. Symptoms include high fever, chills, headache, and anemia. Severe cases can lead to organ failure and death. Malaria is preventable and curable. Control measures include the use of insecticide-treated bed nets, indoor residual spraying, rapid diagnostic testing, and prompt treatment with antimalarial drugs. Vaccines for malaria are under development and have shown promise in reducing disease burden in endemic regions.
