

Structure of a Medical Research Paper

A standard medical research paper is organized into several key sections: Title, Abstract, Introduction, Methods, Results, Discussion, and References. The Title should be concise and informative. The Abstract summarizes the study's objectives, methods, results, and conclusions. The Introduction provides background and states the research question. The Methods section details how the study was conducted, including study design, participants, interventions, and statistical analysis. Results present the findings, often with tables and figures. The Discussion interprets the results, acknowledges limitations, and suggests implications. References cite relevant literature. Adhering to reporting guidelines such as CONSORT (for clinical trials) and STROBE (for observational studies) ensures transparency and reproducibility.
