

Tuberculosis - Symptoms and Treatment

Tuberculosis (TB) is a bacterial infection caused by *Mycobacterium tuberculosis*, primarily affecting the lungs but capable of involving other organs. Symptoms include a persistent cough lasting more than three weeks, chest pain, coughing up blood, night sweats, fever, and weight loss. TB is spread through airborne droplets when an infected person coughs or sneezes. Diagnosis involves sputum examination, chest X-rays, and molecular tests. Treatment requires a combination of antibiotics taken for at least six months. Drug-resistant TB is a growing concern and requires specialized therapy.
